## BINARY DIGITS

Because we have ten fingers we use a number system based on 10. We call it decimals or Hundreds, Ten and Ones. (If spiders could count they would probably use base 8!)

For example, the number 368 means $\mathbf{3}$ times 100 plus $\mathbf{6}$ times $\mathbf{1 0}$ plus $\mathbf{8}$ times $\mathbf{1}$

| 100 | 10 | 1 |
| :---: | :---: | :---: |
| 3 | 6 | 8 |

There is a number system based on 2. Numbers written in base 2 are called binary digits. They contain ones and zeros and nothing else. Instead of 1, 10, 100, 1000 we use 1, 2, 4, 8,16 , etc.

Take the number 26 (in base 10). In binary we would write this as 11010, because we can get 26 using $\mathbf{1}$ times $\mathbf{1 6}$ plus $\mathbf{1}$ times $\mathbf{8}$ plus $\mathbf{0}$ times $\mathbf{4}$ plus $\mathbf{1}$ times $\mathbf{2}$ plus $\mathbf{0}$ times $\mathbf{1}$

| $\mathbf{1 6}$ | $\mathbf{8}$ | $\mathbf{4}$ | $\mathbf{2}$ | $\mathbf{1}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 0 | 1 | 0 |

## Action

- Write the numbers $14,24,11$ and 15 using binary digits
- Convert the binary numbers 11101, 11000, 110 and 11111 into decimals
- Try to write the numbers 83,197 and 128 in binary digits
- Write the number that appears on your front door in binary digits
- Print off and cut out the card-matching task on the next page.
- Match 'em up!

FACT OF THE DAY: The phrase binary digit shortens to BIT (Binary digIT). Eight bits make a byte. A million bytes make 1 Megabyte. (Ever heard of Megabytes..?)

| 74 | 14 | 1100011 | 110110 |
| :---: | :---: | :---: | :---: |
| 108 | 33 | 1000001 | 100001 |
| 127 | 100 | 1111111 | 1100100 |
| 65 | 76 | 1001010 | 1001100 |
| 99 | 54 | 1101100 | 1110 |
